

Greenhouse/ Growing Capabilities

Landscaping isn't our only passion here at EarthWorks. We are also dedicated to offering high-quality products and services, including our plants. Our greenhouses allow us to cultivate our greenery, where we can care for each plant and maximize its growing capabilities. With high-quality plants grown with precision and care, we can offer an impressive selection of flowers and other plans for your property throughout the seasons.

Greenhouse/Growing Capabilities Services

High-Quality and Healthy Plants

Long-term greenery maintenance can only be successful if your plants are healthy, and while plenty comes down to adequate care, how the plants are raised is also important. We give our housed plants a strong foundation and excellent odds to adapt to your property.

Seasonal Color Changeouts

In our greenhouses, we focus on growing plants exclusively for our seasonal color change beds. We grow Pansies, Violas, Dusty Miller, Redbor, Winterbor, Peacock Kale, decorative cabbages, and dianthus in the winter months. We grow Marigolds, Impatiens, and Petunias for the spring color changeouts. For the summer changeout, we grow Pentas, Vinca, Lantana, different forms of Coleus, Potato Vine, Angelonia, and Alternanthera. Additionally, we can offer plants throughout the year and supply you with the required greenery at your convenience.

A Natural Growing Process

In our greenhouse facilities, plants are cared for as they grow strong, and we provide an environment close to the plant's natural growing grounds. Some of the benefits of this process are boosted disease resistance in the plants, strong and resistant cell walls, fully developed root systems, and improved Photosynthesis.

Plant Care to Maximize Growing Capabilities

Texas is a large state with a long list of landscaping firms, but we are one of the few who pride ourselves on having our own greenhouses.

The goal is to offer our customers the highest quality plants and greenery, where the focus lies on quality rather than financial gain. Instead of rushing our plants to grow, we allow them to grow and develop at a slow and steady pace that promotes resilience.
